

BIO-VORTEX

Harmonize, energize, maximize and integrate life force energy into your spaces. Use a Bio-Vortex (BV) in any space where you'd like coherence that provides the foundation for life to thrive. The Bio-Vortex generates an energy field to enhance the energetic expression of everything within its field of influence. The area of influence of the BV is governed by its size. Offered in a variety of sizes and profiles for multiple applications, from personal to agricultural. The area of influence is governed by the size of the BV.

USERS REPORT:

- significantly longer shelf lives of fruits & vegetables; specific to delicate greens (arugula, mizuna, cilantro, etc.) lasting 2 - 2.5 times longer saving users money on food
- farmers report more robust crops, bigger plants, extended shelf lives of produce, and greater profits
- food and water tastes 'better' ; standing water remains fresher
- many LOVE to sleep with a BV hanging over or near their beds and report more sound rest.
- meditators report deeper, more profound meditations
- plants (including food producing) grow (often growing larger 'than normal') and produce more robustly
- some users place a BV in their cars (nothing like smooth, calm, flowing energy for travel)
- animals gravitate to and sleep near coils; small wild animals are commonly seen playing on them
- cut flowers remain hardy and beautiful for significantly longer periods and require fewer water changes

The BV affects energy in all directions from the device. The 'action' of the two ends differs. With the large, open end pointing up, one is drawing energy from the earth; with the apex pointing up, one is drawing energy from the universe; oriented on its side, you make use of both energies.

The area of influence tends to grow as the BV sits in a specific space. Compact options are available for use in refrigerators and portable/personal applications. All BV's, EXCEPT Specialty (Bitty, Compact Bitty and Fridge). come with a removable, adjustable hanger allowing you to hang the BV in any position imaginable. After removal of the BV, the effects of the BV persist for some time. The following notes name/size, diameter of coil, area of influence in feet (conservative and grows over time), and copper tubing size:

- • bitty, compact bitty, personal, bantam: dia: 4.5 - 6"; area - 15'; ¼"
- • refrigerator: dia: 8"; area - 15'; ⅜"
- • small: dia: 7 -8"; area - 35'; ⅜"
- • medium: dia. - 10 - 12"; area - 50'; ½"
- • large: dia. - 17-18"; area - 85'; ½"
- • agricultural: dia. - 20 - 22"; area - 140'; ½"
- • colossal: dia. - 20 - 22"; area - 250'; ¾"

CARE

- DO NOT freeze as water expansion could damage the BV.
- Surfaces are completely bare copper which patinas over time. Should you prefer a 'shinier' surface, juice a lemon or two, rub the juice onto the surfaces and let sit for 10-20 minutes. Rinse and dry. An alternative to using lemon juice is citric acid crystals dissolved in water (equal parts crystals and water).
- Wire wrapped crystals can be re-positioned by 1-2 inches by placing one hand on either end of the wire wrap of each crystal and nudging one end of the wire wrap (right at the ends of each stone where the copper wire is wrapped several times around the tubing) with one hand while pulling the other end of the wire wrap with the second hand. Move the crystal and mount incrementally only and only move when both ends of each stone are moved at the same time. Moving one end at time on small vortices risks unseating the crystal from its mount. Not recommended on personal sized BV's.
- Copper is a SOFT metal. Hung or placed upon surfaces will preserve the shape and integrity. The BV does have a bit of natural spring to it. Placement of the BV should take care to avoid being hit or crushed by heavy items.

MATERIALS

- HVAC copper tubing and copper wire
- natural quartz crystals of several configurations (generally etched & lemurian seed) mounted to exterior; the number of mounted crystals increases with size
- quartz crystals within tubing (which can be heard when the BV is moved); number of crystals increases with size
- energized water
- lead-free solder.

Outer surfaces are left raw to maintain electrical conductivity with the energy potential available in the ethers surrounding the BV. Painting/coating insulates this conductivity.

NOTE: All BV's are delivered with outer surfaces uncoated (and should be left uncoated) - your BV WILL PATINA over time.

Photos across the Bio-Vortex product line contain devices

with varying degrees of patina and are exemplar of how time treats raw copper. Outdoor use causes the darkest patina. The device is built to withstand the elements; the only result will be greater patina.

All crystals are as nature made them, unpolished and unusual in their crystal configuration. Each stone is chosen for its unique qualities and configurations. Some stones contain very minor chips, and single points will generally exhibit a 'broken' end when it was removed from a crystalline matrix. However, etching, apertures, included minerals and crystals can appear as imperfections. Closer inspection reveals what appears as flaws, cracks, chips, are actually:

- Etched quartz is nature's way of 'decorating' exterior surface of the stone with marks that look like hieroglyphs, geometric forms, lines, etc.
- Etching can result from another type of crystal that once grew, eroded away and left a 'footprint' in the surface of the stone
- 'Self-healed' is a moniker for crystal terminations which have been broken and the crystal continued to grow after removal, thus 'healing' the break. Self-healed stone exhibit tiny crystalline growth over a once broken end. Self-healed crystals handle energy like double terminated crystals.

TESTING FOR RESULTS OF BIO-VORTEX USE

The easiest way to observe actual differences in your environment when you make use of a BV is to test on food. It's quick and you can see and taste the results. The best methodology is making use of a control. For instance,

- buy a bunch of bananas
- place half of the bananas near the BV
- place the other half of the bananas outside the influence of the BV. This is your control.
- choose a location for the control bananas that is a similar environment (temp, humidity, etc) as the bananas near the BV.
- observe what occurs over several days
- TASTE the results of your test

For this particular example, note: Does the food last longer? Does it taste better? How does one compare visually to the other? One note specific to bananas: As I experimented with them, I did notice that the exterior of the bananas did not look drastically better than the control. **However**, the flesh of the banana was not as mushy, was not overly sweet, and the peel did not fall apart as easily as the control banana. All of the above are signs that the banana was not decaying at the rate of the control.

You can experiment in many different ways. The only real two tricks are making sure the BV enviro and the control enviro are very similar, and that the control is not too close to the BV. You can test a potted or garden plant that you grow using the above methodology. If you wish to test in an area or specific space, the attributes to observe are: • note how you feel in the space? • are your thoughts/emotions more still? • does the usage of space change? How? From what to what? • do animals seem more at ease? • do animals sleep, sit, rest, play near the BV? • Do you notice any changes in the plants or other living things within the area?
